Hello,  
Here is a picture of the two drives.

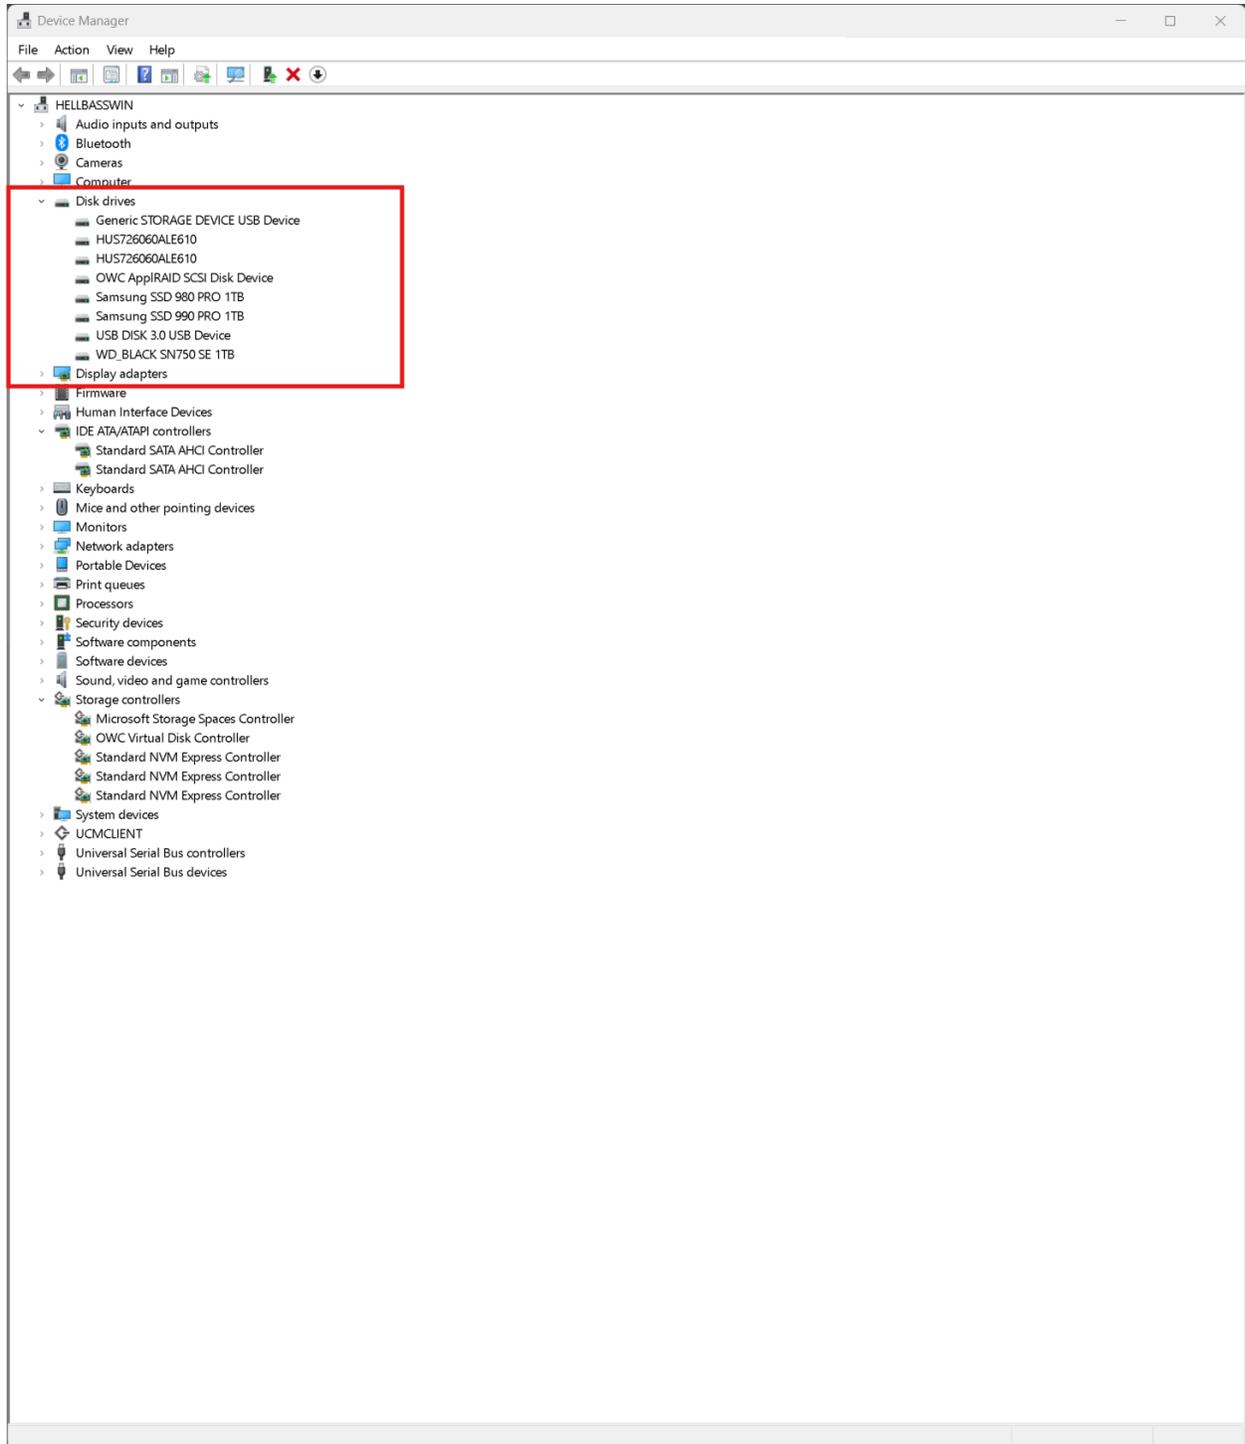

They worked fine for about 9 months and then the volume on the raid stopped mounting either on MacOS where I Primarily use them, or windows (using owc macDrive utility.).

when I checked for the drives using mac os disk utility they no longer showed up in the hardware menu:

This is from today.

The same thing when I put the drives in a windows 11 desktop connected to the motherboard via SATA3, they are not visible in the device manager.

I have also tried them in a USB3 drive dock  
And that also did not work.

There are no error messages in either windows or MacOS as it doesn't seem like the drives are powering up?

Thank you for your help.
